Testing Tables

Model Name	Model equation	Analytic sample	Extra covariates	Estimands
	$\text{logit}(Y_{ik}) = \beta_0 + \beta_1 T_k$	Untreated Individuals	none	Total spillover for untreated people
SpW	$\text{logit}(Y_{ik}) = \beta_0 + \beta_1 T_k$	Untreated Individuals	none	Total spillover for untreated people
	$\text{logit}(Y_{ik}) = \beta_0 + \beta_1 T_k$	Untreated Individuals	none	Total spillover for untreated people
SpWR	$\text{logit}(Y_{ik}) = \beta_0 + \beta_1 T_k + \beta_2 Z_k^{(1)}$	Untreated Individuals	village MC coverage	Remaining spillover after MC-coverage path is held fixed
Ind	$\text{logit}(Y_{ik}) = \beta_0 + \beta_1 T_k + \beta_2 Z_k^{(1)} + \beta_3 Z_k^{(2)}$	Males Only	village MC & HTC coverage	Assignment effect after measured spillover is held fixed (still contains own-uptake + unmeasured spillover)
IndD	$\text{logit}(Y_{ik}) = \beta_0 + \beta_1 T_k + \beta_2 X_{ik}^{(1)} + \beta_3 Z_k^{(1)} + \beta_4 Z_k^{(2)}$	Males Only	own MC $X_{ik}^{(1)}$ + Z's	Controlled-direct effect (paths via own MC **and** measured spillover blocked)
Overall	$\text{logit}(Y_{ik}) = \beta_0 + \beta_1 T_k$	All HIV-negative participants	none	Total impact of CP village assignment (own uptake + *all* spillover)
